

BENEVOLENCE OF THE GODS

A SUE:RA Supplement

By murtalianconfederacy (March 2023)

Apologies for the extremely long time between supplements but, for the second half of 2022 I just lacked the motivation to work on anything SUE-related. That might imply I'd been working with other rulesets, but I can't say that because I haven't. I've been trying to, but I just haven't had the spark of inspiration that could break whatever the 'supplement-designer's equivalent of writer's block is.

Until late January, when I had some ideas (mainly around the idea of having just three 'penetrating levels'—Non-Piercing, standard and Modulating), but as with before, nothing that really worked...until I had the idea that ultimately led to this supplement. It's a minor idea, but it helped coalesce the other concepts: the Accurate trait to all intents and purposes increases the SU cost of a battery by the same amount as one level of Fire Control. That's it, the idea that ultimately brought about this supplement. A fighter-free supplement (no fighters, seekers or anything else that moves during the Fighter Phase) with no need of the Defensive or Accurate trait, meaning the Accurate trait could be re-worked into a battery-specific Fire Control trait. Fast-tracking batteries could be given the Accurate trait to counteract nimble vessels' Countermeasures, while slow-tracking batteries don't have the Accurate trait and can't. Several revisions thus followed (either attempting a more fleet-level setting or a single ship/squadron-level setting) until this version.

Note: in the background section is a fairly long description of subspace, which is how the primary species managed to achieve early space travel and how some vessels utilise **B.5 Cloaking Devices**.

[Note: to cut down on unnecessary information (and to help with the attempts to keep a ship's Drake notation to one page), I've removed extraneous text. The information removed referenced the dual mode and the acronyms of the batteries]

Background of the Setting

"No-one can really understand the principle reason that the Gelandri decided to undertake their mission of pan-galactic preservation and uplift, but the results are clear to see. Across the whole galaxy are relics that testify to their awesome power and their undoubted benevolence...and the unspoken assumption that, had they been more in the vein of 'advanced' powers today, they would easily have established a pan-galactic imperium that could not be challenged..."

"To examine in detail all the Gelandri's engineering marvels would take a planet of xeno-archaeologists several decades, and this work is too modest to even attempt such a task. But the Core Shield, protecting the outlying regions from a near (in cosmological terms) future turning of the SMBH into a quasar is a galactic-level version of one system that this tome will examine in more detail, primarily because it is the most ambitious single-system engineering project undertaken by the Gelandri..."

"This system, known by the primary space-faring inhabitants at this time as Tilopi-Gel'Andri, is not a single, binary or even trinary star system, but consists of seventeen main-sequence stars and two to three times that many dwarf stars (thirty red dwarfs and sixteen brown dwarfs). At the centre is a black hole that defies current theories as to its formation, that seems to act as the anchor of the system, surrounded by a small-scale version of the Core Shield.

"The seventeen main sequence stars are organised (organised is the correct term, as the orbits are entirely too regular to explain by natural phenomena) into one trinary system, four non-contact binary systems and six single stars that orbit the central black hole at distances of between one light-day to two light-weeks. The red dwarfs orbit either independently of the main-sequence stars or orbiting the six single main-sequence stars, while the sixteen brown dwarfs orbit the binary and trinary star systems (eight orbiting the trinary and eight orbiting the four binaries).

"Each of the single star systems has between three to seven solid-surface planets with noticeable gravity and, at most, one rubble belt, while the binary and trinary systems have one such planet and a system-englobing rubble field. All objects associated with a particular star system are found within three light-hours. The entire system, beyond a six light-hour radius from the common centre of each main-sequence star system, has a less-dense rubble field with a density twice that typically found in systems' long-term cometary fields (the star-specific rubble fields are one to two orders of magnitude denser).

"The binary system closest to the black hole is unique in being home to the native species that, because of the Gelandri's actions in seeding the system with a material called intikon'gelan'dri, have spread across the entire system..."

"The trinary star system, named Wilaxi, is noteworthy in being home to a species of space-faring animals known locally as Bioships. Analysis indicates these were modified by the Gelandri, which further indicates the Gelandri viewed them at least as a potentially sentient species.

"Unfortunately, it seems that the complete cosmological engineering project was interrupted by the Fall, when the Gelandri was, in a callous act, wiped out by a species-wide genetically-engineered bio-plague that combined extraordinary 'hardness' (capable of withstanding anything less than weapon-level laser emissions), a dormant phase of several centuries, an extremely fast and lethal (95%) active phase and an exceptional ability to jump species. Released some three centuries before it became active, masked by an extremely capable masking agent, it ensured that all members of the Gelandri, throughout the galaxy, were wiped out in a year. Luckily, they were able to activate quarantine systems, which saved all non-space-faring species, but the length of quarantine effectively ended space travel in the galaxy for ten thousand years..."

"One of the greatest gifts left by the Gelandri was used by the inhabitants of Tilopi-Gel'Andri for several centuries before it was fully understood--the material intikon'gelan'dri, otherwise known as 'chariot of the Gelandri'. An engineering proposal from the Early Thirakan Imperial Era describes the knowledge base at the time:

"Manufacture two hollow torii with *intikon'gelan'dri* and copper, so that hot water can be pumped continuously through each torus. Install each torus on the lower deck of a *tanarkus* [an imperial galley with three banks of oars, each oar operated by a single individual], five *lukkan* [equivalent to one and a half feet] apart. Insert a flattened steel rod lined with *intikon'gelan'dri* on one face only through the centre of each torus. With this arrangement and the correct technique a single rower can propel the *tanarkus* at the same speed that it took two hundred rowers without the torii. With this arrangement the manning requirements can be reduced by nine in ten and still mean our *tanarkii* can stay at sea for [months] on end."

"The text went on to say that, more impressively, it seemed that the torus was anchored to an alternate realm--a torus could be attached to a raft, then elevated and, once elevated, remain in the air. With these simple but revolutionary innovations the Thirakan established one of the major imperial realms for the next three thousand years.

"It was only several centuries later, during the equivalent of the Industrial Revolution, that the material was fully understood. The torus was a portal generator that opened a portal to subspace, a dimension that resisted movement unless there was a propellant that eliminated resistance. The rod's intikon'gelan'dri face eliminated resistance in one direction, allowing the tanarkus to be essentially punted along, the subspace dimension acting like the bottom of a river.

"Intikon'gelan'dri accelerated the progress of the species, enabling not only aerial travel but also space travel. Ships could attain space travel by utilising a portal generator attached to allow the thrust of a rocket to angle through the centre of the torus. With this technique a ship could reach space with a thrust level two to three orders of magnitude lower than would otherwise be the case.

"However, unfortunately, this technique requires close proximity to a gravity well, requiring a body to have a surface gravity of at least 0.01G, whereupon its maximum effect can be felt 25.000km from the centre, weakening linearly to no effect 50.000km from the centre. A body with a surface gravity of at least 1G has a maximum effect radius of 125.000km, and a no-effect radius of 250.000km. This does mean that a celestial object with a radius of 250.000km or greater means that such a drive will only work inside the object.

"No travel beyond this region was possible until the development of the Ion Magneto-Photonic-Augmented Chariot Thruster, or IMPACT, for short. An ion drive with an intikon'gelan'dri-lined thruster coil enabled ships to travel beyond this region. At base power levels the drive is reasonably effective, but the use of magnetic fields to augment the drive provided additional thrust. However, the use of magnetic fields relied upon solar radiation, which meant in some directions only the base power level of the drive was available. Eventually, however, improved solar radiation-capture technologies resulted in the Dimensionless Electro-Photonic Ion Chariot Thruster, or DEPICT, where the drive's maximum thrust potential was available in any direction, although in certain cases IMPACT-powered ships were still quicker.

"One last evolution of the use of subspace came about when an inventor, working with the now-obsolete portal generator technology, devised a triple-torus generator in the mistaken belief this would improve the range that it could operate from a gravity well. Instead, upon activation a region of space (at that time consisting of the inventor's house, the neighbour's personal-vehicle garage and a slim section of the major road in front of the house) surrounding the triple-torus generator disappeared into subspace, subsequently returning once the luckless inventor switched it off again. Subsequent experiments unearthed three startling discoveries. The first was that objects from normal space could travel into subspace completely, travel through subspace, and then re-emerge at a different point in normal-space. The second was that two portal generators, arranged in parallel and connected by intikon'gelan'dri wires, could create a 'one-way portal-tunnel' that enabled a normal-space tunnel to be created through subspace, dependant upon careful positioning of the two torii from each other. The third was that this tunnel could interact with a normal-space object travelling through subspace.

"The discovery of the possibility of using subspace for travel purposes also opened up the possibility of using subspace for attack purposes. Many different weapon types were tried, but only two were successful--the plasma-subspace 'assassin' cannon, and the flak-subspace 'defender' mortar. Both used the 'portal-tunnel' to 'beam' the weapon either in close proximity to, or in, the target."

--excerpts from 'Benevolence of the Gods: an introduction to the galaxy the Gelandri shaped' by Jayare Zleeht (University of Ghad'Landri Press, 003.784. Other scholars' works with a less reverent tone towards the Gelandri dismiss Zleeht's more extreme conclusions but admit the general benevolence of the Gelandri and the horror towards the events leading to the Fall.

Setting-Specific Rules

Accurate trait as Fire Control

As mentioned in the introduction, the Accurate trait does not act as written in the Rules Annex in this setting. In this setting, the Accurate trait acts as a battery-specific version of **B.8 Fire Control**.

Example: a SRB Range-9, 1x4+/1/1 battery with the Accurate trait is engaging a target seven hexes away. This would normally result in a roll of 5 or greater to hit (long-range) but the Accurate trait acts as Fire Control, reducing the roll needed to a 4 or greater.

Solar Sails

A minor alteration to the Solar Sails trait is in effect. Ships with Solar Sails only get a 50% addition to MPs if facing directly away from the solar wind.

Fractional Speed

Ships have a fractional speed rating, providing a number of engine points over a period of four turns. A ship with a fractional speed rating of 9, for example, will have 9 engine points across a period of four turns, equalling 2.25 per turn.

Unless stated otherwise, the first turn of a scenario is always Turn 1.

When writing movement orders for ships, consult the fractional speed rating and use the above table to find out how many movement points for that turn the ship has.

Example: on turn 3, a ship with a fractional engine rating of 5 would have 2 MPs for that turn.

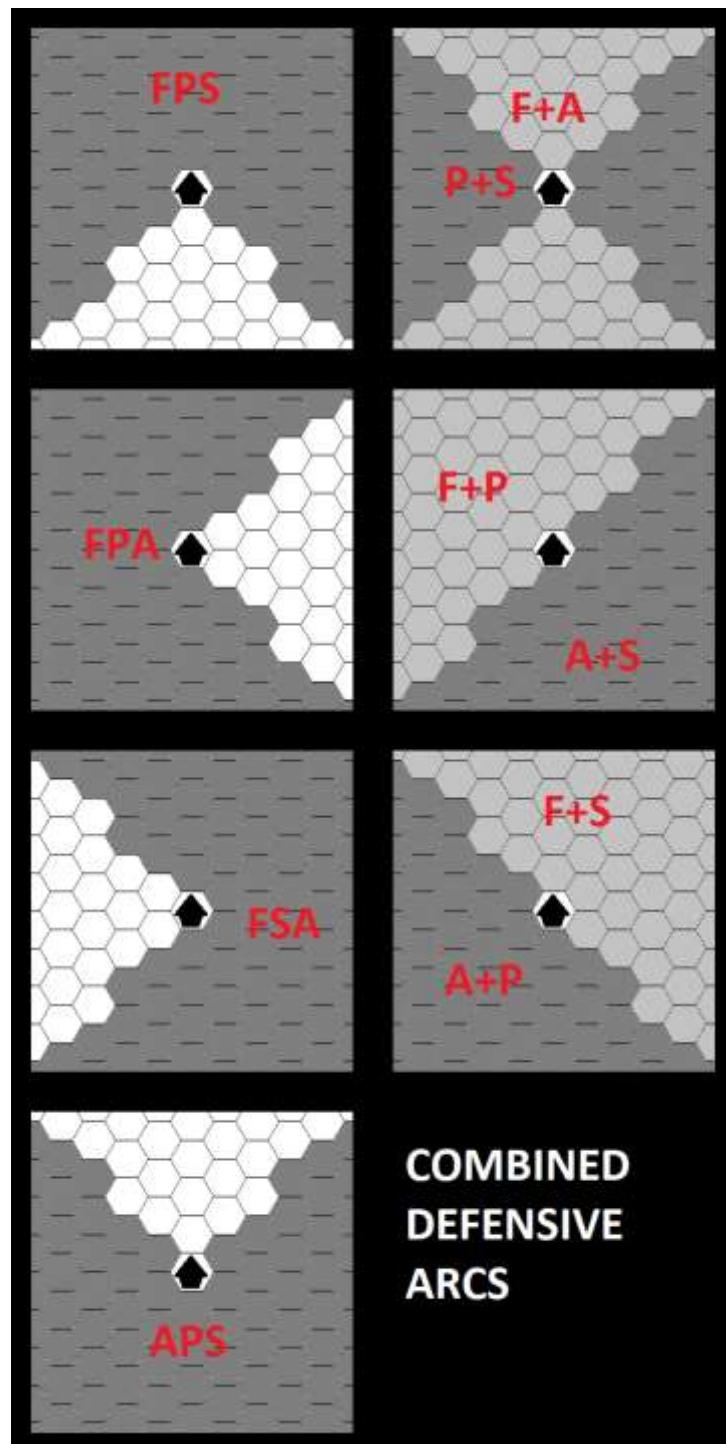

Fractional Speed Chart for Starmada: Unity Edition (Rules Annex)

Speed	Turn 1	Turn 2	Turn 3	Turn 4	Speed	Turn 1	Turn 2	Turn 3	Turn 4
1	0	0	1	0	17	4	4	5	4
2	1	0	1	0	18	5	4	5	4
3	1	1	1	0	19	5	5	5	4
4	1	1	1	1	20	5	5	5	5
5	1	1	2	1	21	5	5	6	5
6	2	1	2	1	22	6	5	6	5
7	2	2	2	1	23	6	6	6	5
8	2	2	2	2	24	6	6	6	6
9	2	2	3	2	25	6	6	7	6
10	3	2	3	2	26	7	6	7	6
11	3	3	3	2	27	7	7	7	6
12	3	3	3	3	28	7	7	7	7
13	3	3	4	3	29	7	7	8	7
14	4	3	4	3	30	8	7	8	7
15	4	4	4	3	31	8	8	8	7
16	4	4	4	4	32	8	8	8	8

New Arcs

Some ships in this supplement make use of new weapon arcs—namely, combinations of two or three Defensive arcs. There are ten potential combinations (well, eleven, but all four Defensive arcs is the same as a TT arc): **F+P** (combining the Fwd and Port arcs); **F+S** (combining the Fwd and Stbd arcs); **A+P** (combining the Aft and Port arcs); **A+S** (combining the Aft and Stbd arcs); **F+A** (combining the Fwd and Aft arcs); **P+S** (combining the Port and Stbd arcs); **FPS** (combining the Fwd, Port and Stbd arcs); **FPA** (combining the Fwd, Port and Stbd arcs); **FSA** (combining the Fwd, Stbd and Aft arcs) and **APS** (combining the Aft, Port and Stbd arcs). The first four and the last four are used in this supplement.

Here is a graphical representation (not that good, I know, but it's something, at least...)

Weapon Descriptions

Weapons can be divided into three ‘tech levels’. The first tech level is binary liquid propellant weapons, abbreviated to BiLPro, and, before the scope of this supplement, were the primary weapons. They are still used by older ships as a secondary anti-ship battery, and civilian ships and bases as their primary battery. As the ships of this supplement are (roughly) analogous to naval ships, BiLPro batteries can be thought of as ‘age of sail’ weapons. The second tech level introduces the old railgun and chaingun batteries as the primary anti-ship and light battery, respectively, which can be thought of as ironclad-era weapons. The third tech level saw the introduction of modern railguns and particle batteries as the primary anti-ship and light battery, respectively, which can be thought of as pre-dreadnought-era weapons. Other weapons are also used, but the above are the primary weapons.

Light batteries (BiLPro, chainguns and particle batteries) are combinations of a single weapon ‘calibre’. ‘Heavier’ batteries are simply larger combinations, which have the ability to hit at longer range.

The primary heavy weapon is the railgun, which come in single mounts and dual turrets. Older railguns have either a standard mode that lacks penetration, with a secondary AP mode, or a standard mode that treats shielding as normal with a secondary shrapnel mode, but the sheer size of the railgun combined with poor reloading procedures results in a weapon that is slow-firing. Single mounts have bad accuracy at longer ranges, but turrets have better accuracy at long range but sacrifice the ability to hit with both chances at longer ranges.

All but the lightest modern railguns possess a shock mode, which can cause significant damage at short range. The lightest modern railgun only possesses a single mount version while all other modern railguns have a single mount and a dual turret. Turrets are space-saving, only being 90% the size of two single mounts but being more vulnerable to battle damage.

In addition to the chaingun/particle batteries and railguns, both old and modern ships have plasma torpedoes, which can ignore all shielding and some screens, and cause structural damage. Plasma torpedoes are either launched singly from tubes or from banks which combine three tubes to create a ‘spread’ of torpedoes that increases the chance of hitting with at least one, but cannot hit with all three.

In addition to the above batteries, there are three traditional weapon types: rockets of four different types—concussion, scatter, EMP and neutron—which are either single-shot (for older ships) or capable of firing multiple times after a lengthy reloading process; plasma torpedoes which are capable of ignoring some or all ships’ shielding and causing heavy damage; and ion cannons, which are capable of causing system damage only.

The discovery of, and subsequent use of, subspace for travel purposes also opened up the possibility of using subspace for attack purposes. Many different weapon types were tried, but only two were successful—the plasma-subspace ‘assassin’ cannon, used by heavier subspace vessels, and the flak-subspace ‘defender’ mortar for a reliable defence against subspace vessels which, even when ‘uncloaked’, might still evade being engaged by traditional batteries. Older ships do use a flak-subspace ‘defender’ torpedo, but they were only-single shot and, with the advent of heavier ammunition for the mortars, were discontinued in modern ships.

Bases use the same weapon types as ships, but these weapons, being stabilised by the greater mass of bases, enjoy longer ranges. However, there are no railgun ‘turrets’ and base railguns are split into two types—a standard version that employs the same two attack methods as ships, and a ‘defender’ version that can be used to defend against subspace vessels or flotillas.

Railguns are designated as one of five or six 'classes', each one of which corresponds to a rough 19th/20th Century naval calibre equivalent. Below are two tables for the standard and old railgun turrets with their equivalent and the SU equivalent of each weapon.

	Equivalent	Single Mount	Dual Mount
Class-1:	6"	12	--
Class-2:	7-8"	20	36
Class-3:	9.2-10"	30	54
Class-4:	11"	50 (49.9)	90 (89.9)
Class-5:	12-13.5"	70	126

	Equivalent	Single Mount	Dual Mount
Old Class-1:	6"	8	14 (13.9)
Old Class-2:	7-8"	12	21 (20.9)
Old Class-3:	9.2-10"	18	32
Old Class-4:	11"	24	42 (41.9)
Old Class-5:	12-13.5"	32 (31.9)	56
Old Class-6:	15-16"	48 (47.9)	84 (83.9)

Civilians

Because of the lack of any fighter-like objects in the setting, I've used tractor beams to represent meteor defence systems, which are present merely to give some units a non-zero Offensive Rating. Point Defence Systems represent non-marine infantry and armoured vehicles to give troop transports a much higher CRAT than would otherwise be the case. Convoys consist of four average-sized freighters or transports

Civilian Freighter Convoy (22)

(note: the light torpedo boat flotilla, and the rocket variant, were originally each a twelve-unit flotilla, but I decided to halve the size and weapon capacity to provide a cheaper unit—and one that isn't such a case of 'all the eggs in one basket')

The light torpedo ram has a lighter version of the plasma ram that isn't as strongly-built as the full-bore plasma ram, meaning only a few attempts of ramming are possible before the plasma capacitors that release their energy when in close to an opponent have to be repaired.

Concussion rockets are a light-weight anti-ship weapon system that was developed around the same time as plasma torpedoes. Rockets are more accurate but lack the raw power of the torpedo.

Traits: Bulkheads (1), Solar Sails

Munitions:

The sloop and the frigate are so close in CRat terms that it's hard to tell the difference. Sloops are harder to hit but can take less damage than frigates, but both have a mix of railguns and BiLPro batteries. Most old naval vessels in this supplement, in 19th century naval terms, are a combination of the central battery ironclad type and the first generation of ironclads, despite having names that suggest something closer to the 'age of sail'

Equipment: Countermeasures (1) (O) (1)

Traits: Solar Sails

Munitions:

Rocket variants mount (unsurprisingly) concussion or scatter rockets. Scatter rockets are used by larger ships to provide additional anti-flotilla firepower. Old rocket variants do, surprisingly, mount defender mortars for protection from subspace vessels.

Equipment: Countermeasures (1) (O) (1)
Traits: Solar Sails
Munitions:

Combining the rocket and patrol variants into one type, but swapping the fleet-oriented concussion and scatter rockets for the more raider-oriented neutron and EMP rockets, produces the raiding variant. These are the only unit that still uses the heavy BiLPro battery to compensate for the loss of the old railguns.

Traits: Bulkheads (3), Solar Sails

Munitions:

Upgunned variants and hybrid battleships have even heavier railguns than gun variants, and are the analogies of those naval ships that attempted to combine sail and turret. In this supplement, however, they're more successful.

Old 1st-Rate Upgunned SotL (191)

Old Bases

Most older fixed defences revolved around the fort, a small base with a range of weapon options, supported occasionally by mines (in actuality, combinations of rocket packs). Heavy bases were used at times, but the lack of dedicated defender cannons left them slightly too vulnerable to subspace vessel attack at times.

Traits: Bulkheads (1)

Munitions:

Flares: 4-3-2-1

The destroyer and flotilla leader are almost the same ship type, the destroyer focused more on the anti-ship role with eight torpedo tubes arranged in a pair forward and two triples amidships, enabling destroyers to bracket enemy ships more effectively.

Munitions:

The sloop and frigate combined in the modern era to provide a still-hard-to-hit ship but one more survivable and capable of hitting hard too. The sloop was also capable of being used for many different roles, including anti-subspace vessel work.

Equipment: (0)

Traits: Bulkheads (3), Ionized Hull

Munitions:

With most units in this supplement being analogous to 19th century naval history, this class is pretty much as close to an idealised version of the pre-dreadnought battleships circa 1890 to 1900 as I could design them.

I have to admit, initially there were different versions of battleships but I decided to re-do the battleships to take advantage of the combined defensive arcs. The original battleship was 'only' 750pts rather than almost 800 as it was one hull smaller and had one extra bulkhead.

Equipment: (0)

Traits: Bulkheads (5), Ionized Hull

Munitions:

The fast battleships are slightly faster than they would 'normally' be, but I decided they needed slightly more of a boost, speed-wise, than a single point of fractional speed.

The fast battleship, and their sister variants, are not able to deal out, or receive, the amount of damage their slower sisters can, but they make a useful fast wing for a fleet.

Equipment: (0)

Traits: Bulkheads (3), Ionized Hull

Munitions:

For the standard battleship, squeezing each pair of Class-1 railguns into a single dual-mount, increasing the amidships mounts to three duals from five singles, losing the scatter rocket launchers and a pair of amidships particle batteries enables enough space to be found for a quartet of Class-2 railguns

(3) 1x2+/1/1

[FR4] // (1)

Equipment: Cloaking Device (O), Countermeasures (1)

(O), Stealth (1) (O) (2)

Traits: Bulkheads (1)

Munitions:

Modern subspace cruisers mount the 'assassin' cannon, which uses subspace to 'launch' a plasma charge, bypassing ships' shielding to hopefully cause catastrophic damage. However, the weapon is extremely short-ranged and cannot be mounted on a non-subspace vessel as it uses the subspace drive to prime the cannon. The name for the weapon was derived from the fact that at least three battleships carrying heads of state were severely crippled by opposing subspace cruisers.

Modern Bases

The old forts developed into emplacements which are even more unlikely to be targeted successfully by opposing ships, and batteries which are sturdier and can be thought of as the nucleus of a dispersed base system. In addition, several heavy bases exist, ranging from the light outpost to the heavy base.

Traits: Immobile

Munitions:

Minefields represent a cluster of mines ranging throughout the area covered by the weapons, with the ‘centre’ hex containing the mine control centre. There are three ‘types’ of mine—the General Purpose mine, the Anti-Capital mine which sacrifices accuracy for some armour-piercing ability, and the Anti-Flotilla mine, which is more accurate and can target lighter ships but lacks armour-piercing ability. There are five minefield types, two of which combine mines of two types.

Equipment: (0)

Traits: Regenerating

Munitions:

Male adolescent bioships grow a single ‘twinned’ bio-pellet launcher which is to all intents and purposes a heavy bio-pellet launcher. When growing into other types, the emergence of the bio-laser or bio-maser emitter splits this twinned launcher into two single lighter bio-pellet launchers

Munitions:

Bio-predators are similar to, but different from, bio-hunters. Bio-hunters defend bioship shoals, while bio-predators prey on anything they come across—including other bioships. Bio-predators tend to operate either singly or in small packs, and bio-predators will attack other bio-predators of different packs.

Behind the Scenes: The original battleship design

For most of the time taken during the creation of this supplement, the ‘standard’ battleship was a full 40 to 50pts cheaper than the version presented above. To give you a taste of those other battleships, here’s the original version. The only difference the ‘current’ battleship class possesses (except for the increase in hull and reduction of bulkheads to make an even 20 hull-equivalent) are the arcs of the C5RTs, an extra pair of class-1s and particle batteries, and a doubling of the number of scatter rockets. Some other battleships had similar changes, but some remained the same.

Battleship (750)
